

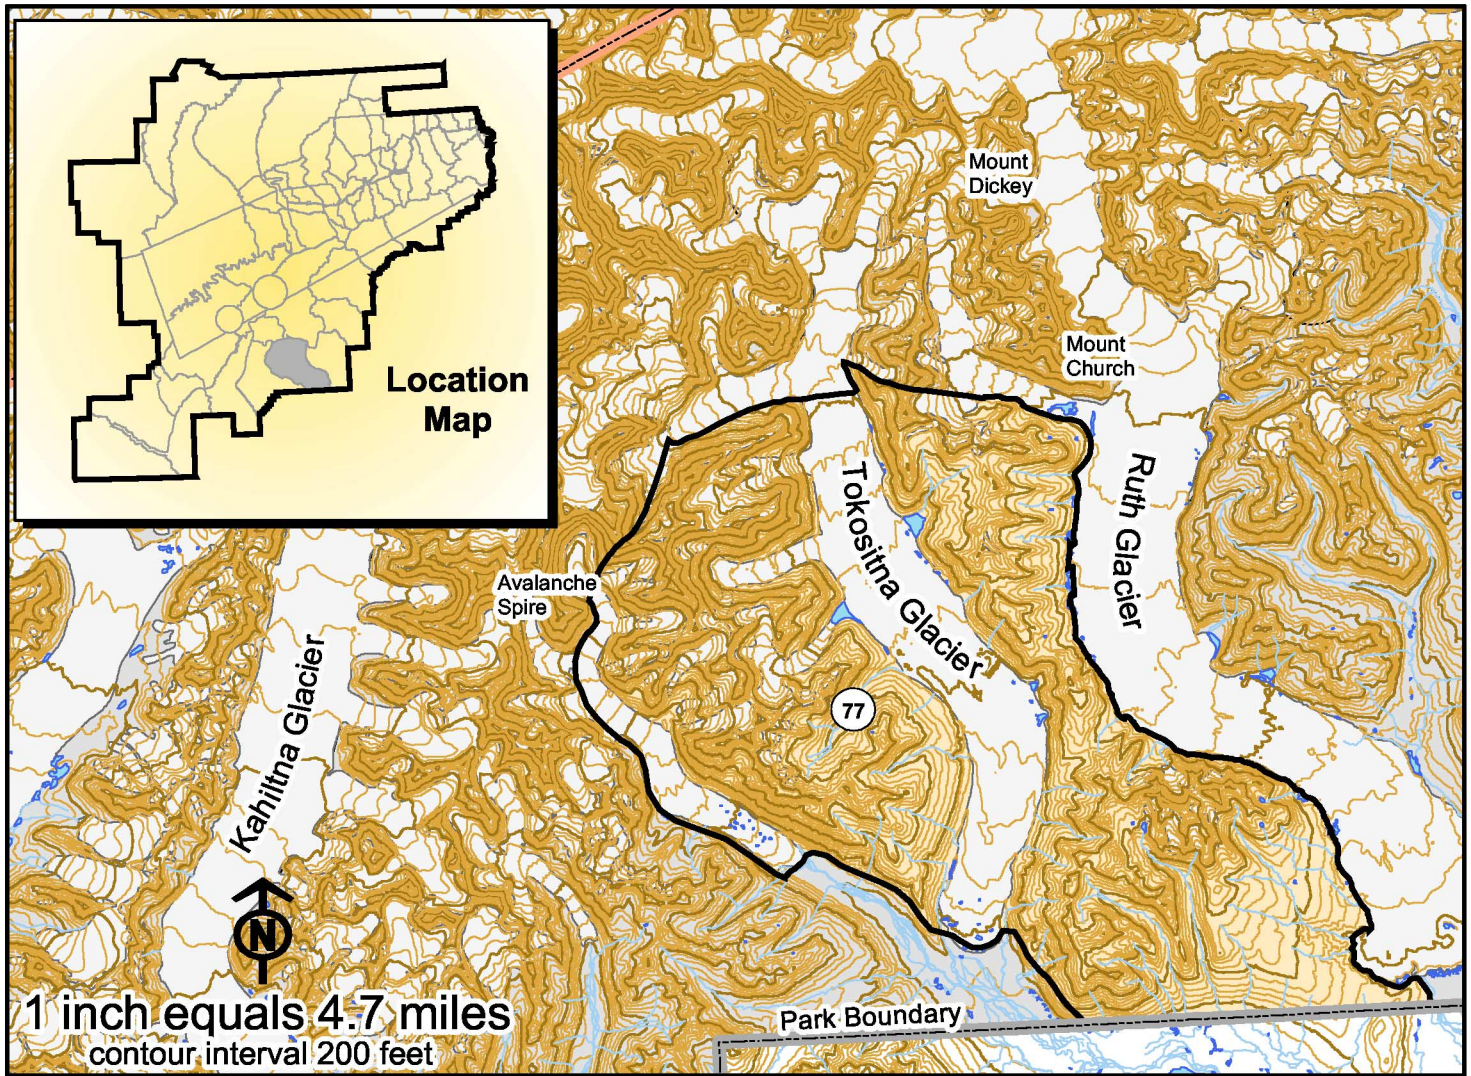

Map 2-48 - Tokositna Glacier (Unit 77)

Tokositna Glacier (Unit 77)

Bare ground, snow and ice, and herbaceous shrub. Lower elevations contain important wildlife habitat, including trumpeter swan and bald eagle nesting sites, bear dens, and salmon spawning in the upper Tokositna River. There is one cabin. Tokositna Glacier is a surging glacier.

The Tokosha Mountains have been a climbing destination during some years. Much of the southern half of this unit receives considerable snowmachine use during the winter season. Summer activities include some hiking and climbing as well as boating and fishing on the Tokositna River. Wilderness experience is degraded by snowmachine use and overflights.
